

**Project Title:** Flask deployment (Predictive analysis on House Prices)

**Report date:** 27th March 2023

**Internship Batch:** LISUM19

**Version:** 1.0

**Name:** B. Harika

**Submitted to:** Data Glacier

**Data storage location:**

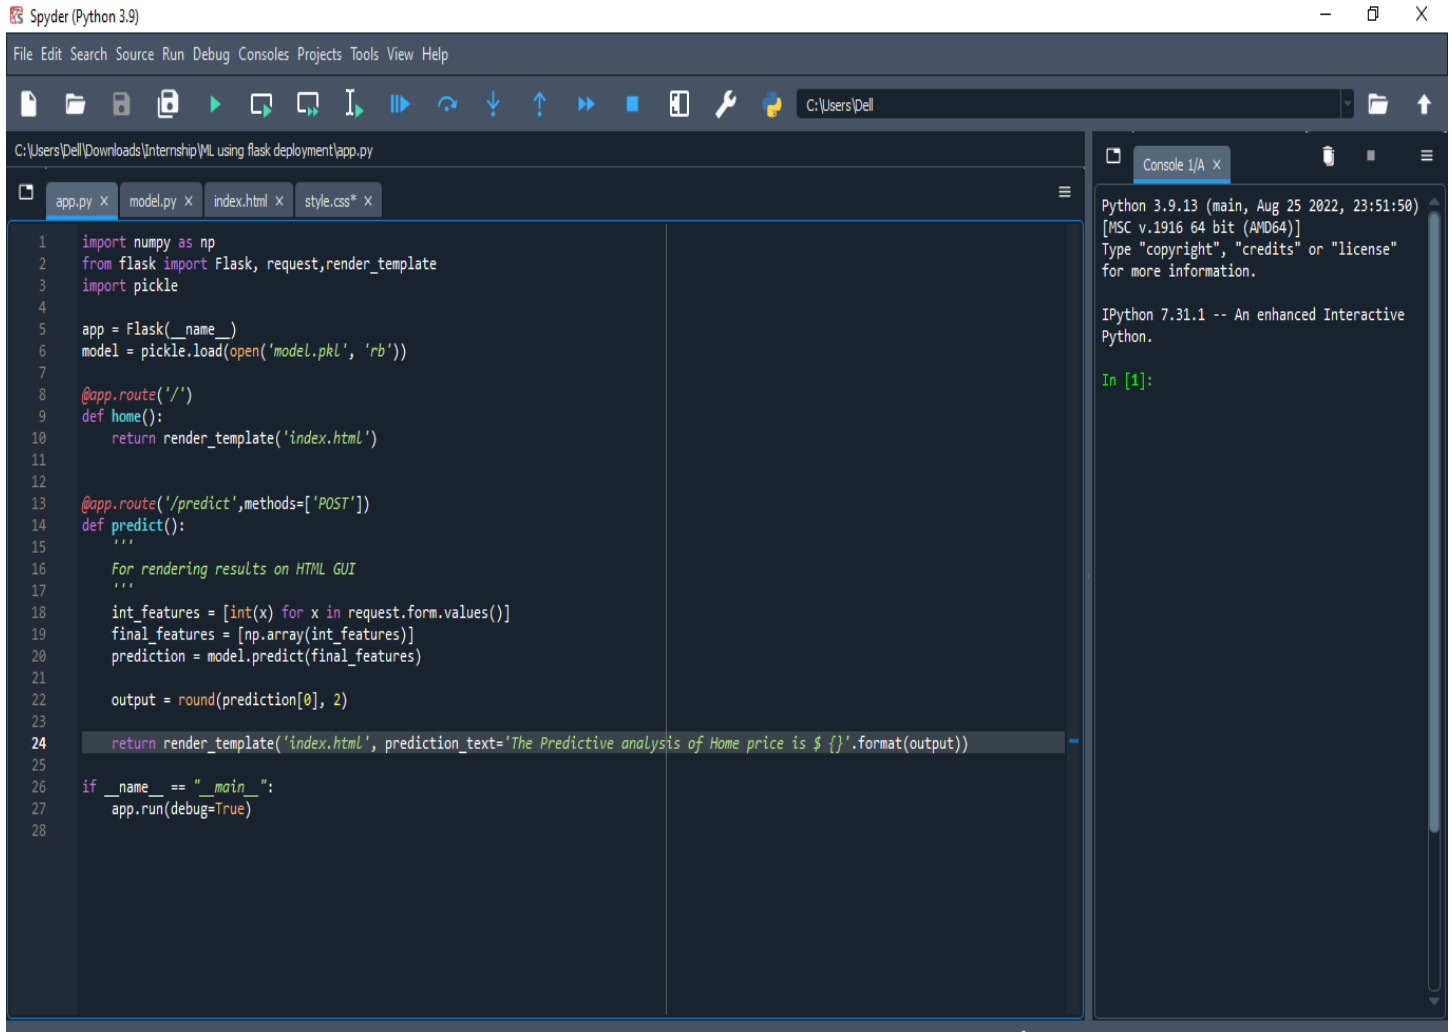

[https://github.com/HarikaReddyB/ML\\_model\\_deployment\\_on\\_Flask](https://github.com/HarikaReddyB/ML_model_deployment_on_Flask)

## Downlaoding the dataset by Kaggle datasets:

The screenshot shows the Kaggle website interface. The browser address bar displays 'kaggle.com/datasets/pankeshpatel/homepricesmultiplevariables'. The page title is 'homeprices-multiple-variables'. Below the title, there are tabs for 'Data Card', 'Code (7)', and 'Discussion (0)'. The 'Data Card' tab is active. On the left sidebar, the 'Datasets' section is highlighted. The main content area shows the dataset 'homeprices.csv' (123 B) with a download icon. Below this, there is a section 'About this file' with a description: 'Sample data of housing price. We have used this small data set to create a tutorial -- Machine learning for absolute beginners. The topic is Multivariate Regression.' At the bottom, there is a table with 4 columns: '# area', '# bedrooms', '# age', and '# price'. Each column has a description and a '6 total values' indicator.

# area	# bedrooms	# age	# price
area of home in square feet	number of bedrooms in a house	age of a house	price of a house
6 total values	6 total values	6 total values	6 total values

## app.py for flask deployment

The image shows the Spyder Python IDE interface. The main editor window displays the code for `app.py`, which is a Flask application. The code imports `numpy` and `Flask`, loads a pre-trained model from `model.pkl`, and defines two routes: `home()` and `predict()`. The `predict()` route handles POST requests, processes the input features, and returns a prediction. The console on the right shows the Python environment details and the IPython prompt.

```
1 import numpy as np
2 from flask import Flask, request, render_template
3 import pickle
4
5 app = Flask(__name__)
6 model = pickle.load(open('model.pkl', 'rb'))
7
8 @app.route('/')
9 def home():
10     return render_template('index.html')
11
12
13 @app.route('/predict', methods=['POST'])
14 def predict():
15     """
16     For rendering results on HTML GUI
17     """
18     int_features = [int(x) for x in request.form.values()]
19     final_features = [np.array(int_features)]
20     prediction = model.predict(final_features)
21
22     output = round(prediction[0], 2)
23
24     return render_template('index.html', prediction_text='The Predictive analysis of Home price is $ {}'.format(output))
25
26 if __name__ == "__main__":
27     app.run(debug=True)
28
```
